Euler equations  
with phase  
transition

M. Hantke

Outline

Introduction

Previous results

Model description  
- nonisothermal  
case

Phase boundaries

Creation of new  
phases

Equations of state

## Isothermal Euler equations

$$\begin{aligned}\rho_t + (\rho v)_x &= 0 \\ (\rho v)_t + (\rho v^2 + p)_x &= 0\end{aligned}$$

## Jump conditions across discontinuities

$$\begin{aligned}[[\rho(v - W)]] &= 0 \\ \rho(v - W)[[v]] + [[p]] &= 0\end{aligned}$$

## Mass flux across discontinuities

$$Z = -\rho(v - W) \quad \text{with} \quad Z, W = \begin{cases} Q, S & \text{shock wave} \\ z, w & \text{phase boundary} \end{cases}$$

## Kinetic relation

$$z = 0 \quad \text{or} \quad z = \frac{p_V}{\sqrt{2\pi}} \left( \frac{m}{kT_0} \right)^{3/2} [[g + e_{kin}]]$$

# Model description - nonisothermal case

Euler equations  
with phase  
transition

M. Hantke

Outline

Introduction

Previous results

Model description  
- nonisothermal  
case

Phase boundaries

Creation of new  
phases

Equations of state

- Euler equations
- Equations of state
- Jump conditions across discontinuities <sup>1</sup>

$$0 = \frac{\partial \rho_I}{\partial t} - \llbracket z \rrbracket$$

$$0 = \frac{\partial(\rho_I w)}{\partial t} - \llbracket zv \rrbracket + \llbracket p \rrbracket$$

$$0 = \frac{\partial e_I}{\partial t} + \llbracket -z(e + \frac{p}{\rho} + \frac{1}{2}(v-w)^2) + q \rrbracket$$

- Kinetic relation

$$z = 0 \quad \text{or} \quad z = ?$$

- Entropy condition

$$0 \leq \zeta = \frac{\partial s_I}{\partial t} + \llbracket -zs + \frac{q}{T} \rrbracket$$

<sup>1</sup>Dreyer, On Jump Conditions at Phase Boundaries for Ordered and Disordered Phases, WIAS Preprint, 869, 2003

# Case I: $z = 0$ - no phase transition

Euler equations  
with phase  
transition

M. Hantke

Outline

Introduction

Previous results

Model description  
- nonisothermal  
case

**Phase boundaries**

Creation of new  
phases

Equations of state

- Balances across the phase boundary simplify

$$v_L = v_V = w \quad p_L = p_V$$

- Phase boundary is a contact wave

The exact solution is selfsimilar and can be constructed easily.

## Case II: $z \neq 0$ - phase transition may occur

### Euler equations with phase transition

M. Hantke

Outline

Introduction

Previous results

Model description  
- nonisothermal  
case

Phase boundaries

Creation of new  
phases

Equations of state

- Simplifying assumptions:  $\rho_I = 0, e_I = 0 \Rightarrow \frac{\partial s_I}{\partial t} = 0$
- Balances across the interface

$$0 = \llbracket z \rrbracket \Leftrightarrow 0 = \llbracket \rho(v - w) \rrbracket$$

$$0 = -z \llbracket v \rrbracket + \llbracket p \rrbracket$$

$$0 = z \llbracket \left( e + \frac{p}{\rho} + \frac{1}{2}(v - w)^2 \right) \rrbracket$$

- Entropy condition

$$0 \leq \zeta = -z \llbracket s \rrbracket$$

- Kinetic relation

$$z \sim -\llbracket s \rrbracket$$

## Case IIa: $z \neq 0$

Euler equations  
with phase  
transition

M. Hantke

Outline

Introduction

Previous results

Model description  
- nonisothermal  
case

Phase boundaries

Creation of new  
phases

Equations of state

- Entropy condition

$$0 \leq \zeta = -z[[s]]$$

- Kinetic relation

$$z \sim -[[s]]$$

- The exact solution is selfsimilar and can be constructed easily.
- Two classical shock or rarefaction waves, contact wave, phase boundary

- Problem: Thermal equilibrium cannot occur. Only evaporation processes are possible.

## Case IIb: $z \neq 0$

Euler equations  
with phase  
transition

M. Hantke

Outline

Introduction

Previous results

Model description  
- nonisothermal  
case

Phase boundaries

Creation of new  
phases

Equations of state

We need more general assumptions!

- Balances across phase boundaries

$$0 = \frac{\partial \rho_I}{\partial t} - \llbracket z \rrbracket$$

$$0 = \frac{\partial(\rho_I w)}{\partial t} - \llbracket zv \rrbracket + \llbracket p \rrbracket$$

$$0 = \frac{\partial e_I}{\partial t} + \llbracket -z(e + \frac{p}{\rho} + \frac{1}{2}(v-w)^2) + q \rrbracket$$

- Entropy condition

$$0 \leq \zeta = \frac{\partial s_I}{\partial t} + \llbracket -zs + \frac{q}{T} \rrbracket$$

- Taking into account heat conduction

$$\frac{\partial s_I}{\partial t} \neq 0$$

## Case IIb: $z \neq 0$

Euler equations  
with phase  
transition

M. Hantke

Outline

Introduction

Previous results

Model description  
- nonisothermal  
case

Phase boundaries

Creation of new  
phases

Equations of state

- Simplifying assumptions:  $\rho_I = 0$
- Balances across phase boundaries

$$0 = \llbracket z \rrbracket \quad \Leftrightarrow \quad 0 = \llbracket \rho(v - w) \rrbracket$$

$$0 = -z \llbracket v \rrbracket + \llbracket p \rrbracket$$

$$0 = \frac{\partial e_I}{\partial t} - z \llbracket (e + \frac{p}{\rho} + \frac{1}{2}(v - w)^2) \rrbracket$$

- Entropy condition

$$0 \leq \zeta = \frac{\partial s_I}{\partial t} - z \llbracket s \rrbracket$$

■

$$e_I = e_I(T_I)$$

- Kinetic relation

$$z = \frac{p_V}{\sqrt{2\pi}} \left( \frac{m_0}{kT_I} \right)^{3/2} \llbracket g + Ts + \frac{1}{2}(v - w)^2 - sT_I \rrbracket$$

## Case IIb: $z \neq 0$ - surfacial tension

Euler equations  
with phase  
transition

M. Hantke

Outline

Introduction

Previous results

Model description  
- nonisothermal  
case

Phase boundaries

Creation of new  
phases

Equations of state

$$e_I = -T_I^2 \frac{\partial \frac{\sigma(T_I)}{T_I}}{\partial T_I} \neq \text{const!}$$

- $\sigma \equiv \text{const}$  cannot be used!
- Eötvös rule? Also a linear relation for  $\sigma$  cannot be used!
- Katayama-Guggenheim rule

$$\sigma = \sigma_0 \left(1 - \frac{T_I}{T_c}\right)^{11/9}$$

may be used.

- **Problem: Selfsimilarity of the solution is lost!**

# Examples - behaviour of the phase boundary

## Euler equations with phase transition

case

Phase boundaries

Creation of new  
phases

Equations of state

Initial data:  $T_L = 293.15K$ ,  $p_L = 2339Pa$ ,  $v_L = 0$ ,  $T_V(0) = 313.15K$

The system runs into a steady state within  $t \leq 0.2 \cdot 10^{-9}s!$

# Example 3

Euler equations  
with phase  
transition

M. Hantke

Outline

Introduction

Previous results

Model description  
- nonisothermal  
case

Phase boundaries

Creation of new  
phases

Equations of state

Initial data:  $T_L = 343.15K$ ,  $p_L = 31200Pa$ ,  $v_L = 0$ ,  $T_V(0) = 318.15K$

The system runs into a steady state within  $t \leq 0.5 \cdot 10^{-10}s!$

# Summary phase boundaries

## Euler equations with phase transition

M. Hantke

Outline

Introduction

Previous results

Model description  
- nonisothermal  
case

**Phase boundaries**

Creation of new  
phases

Equations of state

- similar results for other sets of initial data
  - for higher temperatures the process is faster
  - analytical proof?
  - maybe helpful for numerical solutions?
- 
- Simplifying assumptions have big influence on the solution and its structure.

$$p_L \geq p_V$$

# Creation of new phases

Euler equations  
with phase  
transition

M. Hantke

Introduction

Previous results

Model description  
- nonisothermal  
case

Phase boundaries

Creation of new  
phases

Equations of state

From now on the fluid under consideration is water.

- Situation 1: pure water vapor is compressed
- Situation 2: pure liquid water is expanded

Isothermal case

- For sufficiently high compression of water vapor liquid water is created.
- By sufficiently strong expansion of liquid water water vapor can be created.

Nonisothermal case?

# Creation of liquid water

## Euler equations with phase transition

M. Hantke

Model description  
- nonisothermal  
case

Phase boundaries

Creation of new  
phases

Equations of state

## Theorem 1: Nonexistence result (MH, Ferdinand Thein, 2014)<sup>2</sup>

Using the real equations of state for water or any good approximation of the real equation of state condensation by compression cannot occur.

This result holds for

- compressible Euler equations, phase transitions modeled by a kinetic relation
- compressible Euler equations, phase transition modeled using an equilibrium assumption
- models of Baer Nunziato type, phase transition modeled using relaxation terms

---

<sup>2</sup>Hantke, Thein, Why condensation by compression in pure water vapor cannot occur in an approach based on Euler equations, accepted for publication in Quarterly of Applied Mathematics

Euler equations  
with phase  
transition

M. Hantke

Outline

Introduction

Previous results

Model description  
- nonisothermal  
case

Phase boundaries

Creation of new  
phases

Equations of state

Proof.

- uses wave curves
- no intersection point with the saturation line
- no mechanism for phase transition

Consequence.

- no analogous results as in the isothermal case
- minimum requirement for an EOS

Corollary.

- adiabatic processes don't allow creation of liquid water
- if in any process liquid water is created Euler equations cannot be used

Open questions.

- Analogous results for other fluids?
- Analogous results for all fluids?

# Creation of water vapor

Euler equations  
with phase  
transition

M. Hantke

Outline

Introduction

Previous results

Model description  
- nonisothermal  
case

Phase boundaries

Creation of new  
phases

Equations of state

## Theorem 2: Nonexistence result (MH, Ferdinand Thein, 2014)

Using the real equation of state for water or any good approximation of the real equation pure water vapor cannot be created in an approach based on Euler equations and an equilibrium assumption.

This result holds for

- compressible Euler equations, phase transition modeled using an equilibrium assumption
- models of Baer Nunziato type, phase transition modeled using relaxation terms
- The creation of a mixture of water vapor and liquid water (wet steam) is possible.
- The mass fraction of water vapor is bounded

$$\mu \leq 0.5.$$

- Reason: models don't allow entropy production

# Choice of the EOS

## Euler equations with phase transition

M. Hantke

Outline

Introduction

Previous results

Model description  
- nonisothermal  
case

Phase boundaries

Creation of new  
phases

Equations of state

- classical EOS give very bad descriptions of real fluids
- analysis for IAPWS almost impossible
- using IAPWS is complicated
- using tabled EOS is problematical from mathematical point of view
- generalized Tait equation for water
